All communications received on or before the closing date for comments will be considered by the Transport Standards Staff before issuing the final AC.

**Discussion**

A common cause of airplane fires has been the ignition of leaked flammable fluids. The primary means of preventing these fires is to safely drain the fluid away from the airplane, both in flight and on the ground, and to provide ventilation that results in a lean fuel to air mixture. The purpose of this AC is to provide guidance in what factors should be considered in the design of flammable fluid drainage systems and ventilation systems, and to describe a means of showing compliance with the sections of the FAR that require these systems. This AC provides information and guidance concerning a means, but not the only means, of compliance with the portions of part 25 of the FAR pertaining to certification requirements for compartments in transport category airplanes that contain flammable fluid leakage sources.
